**What exactly  
is Mesh  
Networking?**

2

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Star Network**

Bluetooth is what is referred to as a '**star-type topology**'. This means that all devices connect to **one central hub** rather than communicating with each other. The only way to expand the network is to connect more devices to the central hub.

3

3

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

With **mesh networking**, all of the devices in a network can **communicate with each other**, rather than having to connect with one central hub. This makes the size and area of the network virtually unlimited, which is why it is so useful for industrial IoT applications like large connected sensor networks.

**Bluetooth Mesh Network**

### New Words...New Terms...New Concepts!!!

8

8

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

**Device and Node**

A **node** is a device that has joined a Bluetooth mesh network.

Devices that are not part of the network are called **unprovisioned devices**.

Once an unprovisioned device gets **provisioned**, it joins the network and becomes a node.

The diagram illustrates the transition from an unprovisioned device to a node. On the left, a small blue circle labeled "Unprovisioned Device" is shown with an arrow pointing towards a larger circle labeled "Bluetooth mesh Network". Inside the "Node" circle, there is a smaller cluster of circles representing the network structure.

9

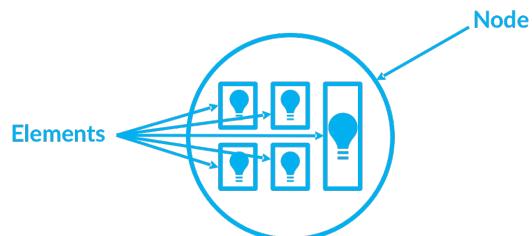

9

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

**Elements**

A **node** may contain multiple parts which can be controlled independently.  
 (e.g a light fixture may contain multiple light bulbs which can be turned on/off independently).

These different parts of a single node are referred to as **elements**.

The diagram shows a large circle labeled "Node" containing several smaller icons representing light fixtures. Arrows point from the label "Elements" to these icons, indicating that a single node can contain multiple controllable components.

10

10

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

***Messages and State***

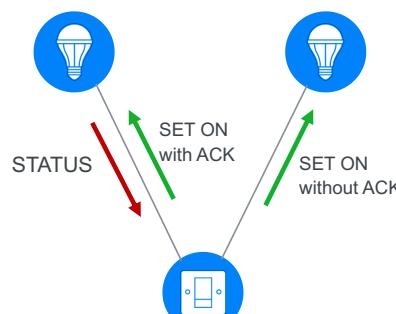

Communication between nodes in a mesh network is accomplished through sending ***Messages***.  
 Messages are associated with Model and operate on States.

A ***State*** represents the condition of some aspect of an Element together with some associated behaviors.

State-A: OnOff = Off->ON      State-B: OnOff = Off-> ON

All messages belong to three generic types:

- GET*** : to request the value of a state at one or more nodes. It receives a STATUS message as a response.
- SET*** : to change the state value of a node or group of nodes. Set messages can be with acknowledged or unacknowledged.
- STATUS*** : notify current state.

11

11

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

***Address***

Bluetooth mesh uses a system of various address types to identify individual Elements or set of Elements.

***Unicast Address*** identifies a single, specific Element of a Node. A provisioner manages the allocation of unicast addresses and ensure that there are no duplicates in the network.

***Group***, it is a multicast address that represents one or more elements.  
 Bluetooth SIG has defined 4 standard group:  
 ALL PROXIES, ALL FRIEND, ALL RELAY, ALL NODES  
 Moreover they can be dynamically defined by the user through the configuration procedure.  
 There may be up to 16383 group addresses in a mesh network.

***Virtual Address***, may be assigned to one or more Elements. It takes the form of a 128-bit UUID value and it is much like a label. There may be up to 70 trillion of virtual addresses.

12

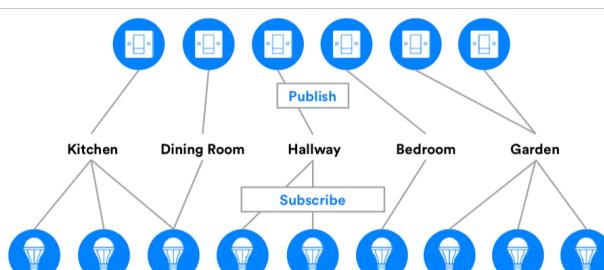

12

**Università Politecnica delle Marche**  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica
 

### Publish / Subscribe

Messages sent and received across the mesh network conform to a publish-subscribe model of communication.

- Sending messages from one node to a set of one or more other nodes is referred to as **Publishing**.
- Configuring a node to receive certain messages is known as **Subscribing**.
- Typically, messages are addressed to group or virtual addresses.

13

13

**Università Politecnica delle Marche**  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica
 

### Models

A Model defines **node functionality**: States, States Transitions, State Binding, Messages and other associated behaviors.

An Element within a Node must support one or more models.

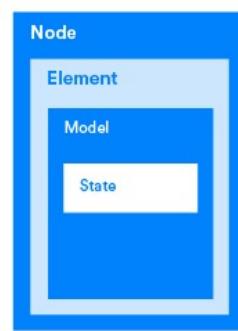

There are three broad category of models:

- **SERVER** model defines the different states that the element to which the model belongs can send and receive.
- **CLIENT** model didn't define any state, but only messages that can be sent and receive (GET, SET e STATUS)
- **CONTROL** model contains both the server and client model.

Bluetooth SIG defines some standard types of models:

1. **Foundation** configuration and Health
2. **Generic** On/Off, Level, Power, Location, Transition Time, Properties
3. **Sensors** Sensor, Time
4. **Lightinig** Light, Lightness, CTL, HSL, xyL, Controller
5. **Vendor specific models**

14

7

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

**Generic OnOff Model**

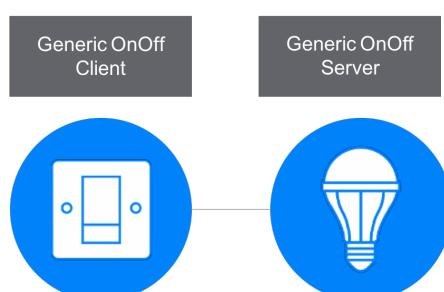

The simplest generic model is the Generic OnOff Model. It define a single State, called Generic OnOff, which may have value:

- 0x00 to rappresent Off
- 0x01 to rappresent On

The Model defines 4 type of messages:

1. Generic OnOff Get
2. Generic OnOff Set
3. Generic OnOff Set Unacknowledged
4. Generic OnOff Status

15

**Bluetooth Mesh**

17

17

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

To create a Bluetooth Mesh Network and make each device actively participate in the network, it must switch from a status of Unprovisioned Device to the Configured Mesh Node status.

18

18

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

***Provisioning***

***Provisioning*** is the process by which a device is added to a mesh network. After being provisioned, a device is referred to as a ***Node***.

Provisioning involves a five step process:

- 1 BEACONING
- 2 INVITATION
- 3 EXCHANGING PUBLIC KEYS
- 4 AUTHENTICATION
- 5 DISTRIBUTION OF THE PROVISIONING DATA

19

19

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

***Provisioning***

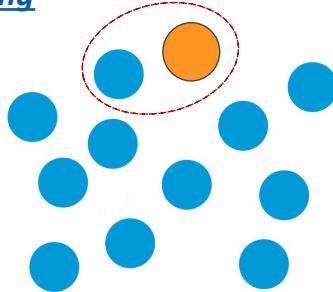

***1 - Beaconing***

I – Each unprovisioned device communicates periodically in broadcast its availability to be provisioned by sending the ***mesh beacon advertisement***.

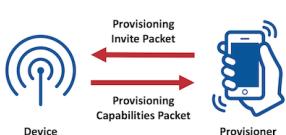

II – when the provisioner detects a request for a unprovisioned node to be able to access the network, a 1:1 communication begins.

***2 – Invitation***

The provisioner sends an invitation to the device to be provisioned in the form of ***Provisioning Invite PDU***. The device responds with information about itself sent via ***Provisioning Capabilities PDU***.

● Unprovisioned device  
● Provisioner

 Corso di Laurea in Ingegneria Elettronica
 

## Provisioning

### 3 -Exchanging Public Keys

Provisioner and unprovisioned node exchange their public keys, which can be static or ephemeral.

Device (A)

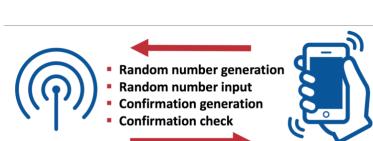

Provisioner (B)

### 4 – Authentication

The device to be provisioned generates a pairing sequence based on its hardware capabilities:

- blinking led
- numerical sequence if a display is present

Side Provisioner an input device must be present, a button for the first method and a numeric keypad for the second.

Device

Provisioner

21

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

## Provisioning

### 5 – Distribution Of The Provisioning Data

A SESSION KEY is generated from the private keys and the public key exchanged.

This key will be used to distribute all the data necessary to complete the provisioning process:

- NetKey (Network Key)
- DevKey (Device Key)
- A security parameter called IV index
- A Unicast address.

From this moment on, the device will be called **NODE!!!**

The diagram illustrates the provisioning process. A central orange circle, labeled "Provisioner", is connected to six green circles, each labeled "Node". Each green node has a single-headed arrow pointing towards the provisioner, indicating the direction of data flow during the provisioning process. Surrounding these nodes are five blue circles, each labeled "Unprovisioned node", representing devices that have not yet been provisioned.

Legend:

- Unprovisioned node (Blue circle)
- Provisioner (Orange circle)
- Node (Green circle)

22

22

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Configuration**

Process by which the user defines for each model of the node: the intended use (AppKey), the publication address (Client) / subscription (Server) and any added features (ACK enabling, number of retransmissions, relay function , ...)

The configuration can be performed via provisioner or via smartphone/tablet/pc with a specific app.

23

23

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Type Of Node**

In a mesh network all the nodes are able to receive and send messages, however there are some particular features that a node can possess, which allows it to have special capabilities.

- Relay Nodes
- Proxy Nodes
- Friend Nodes
- Low Power Nodes

24

24

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Relay nodes**

Messages get sent to the other nodes that are in direct radio range of the publishing node, but if the nodes to be reached are out of range, a "repeater" or messages is necessary to allow it to arrive at destination.

A Relay node can retransmit messages that are broadcast by other nodes.

This type of node is essential to extend network coverage and allow messages to be transmitted internally.

R = Relay function ON

25

25

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Proxy nodes**

Enable message proxy between Bluetooth Mesh and GATT devices like Smartphones, ipad

This type of node is also necessary to perform the provisioning process via devices that don't support Advertising Bearer. (e.g. smartphone, tablet, pc)  
A specific app must be installed for this purpose.

There may be one or more proxy nodes in a Bleutooth mesh network

26

26

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

**Friend Nodes and Low Power Nodes**

**Low Power Nodes** are equipment with limited energy resources. (e.g sensors)

To avoid always listening on the radio channels to receive messages from the mesh, LPN works with a Friend Node.

The **Friend Nodes** store the messages addressed to the LPN with whom they are friends, and forward them when the LPN reactivates the radio channel.

Friend  
  
**STORED MESSAGE(S)**

Low Power Node (sensor)  

```

graph TD
    Friend((Friend)) <-->|"To: Sensor<br>"set temperature thresholds""| Sensor((Low Power Node (sensor)))

*How data is transmitted within the  
Bluetooth Mesh*

28

**Università Politecnica delle Marche**  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica
 

### Data Transmission

There are two primary techniques used to relay data across the mesh networks, namely routing and flooding.

<p><b>Routing</b></p> <ul style="list-style-type: none"> <li>• Transmission along a selected path</li> <li>• Use of specific nodes to relay messages: router</li> <li>• Need for routing table</li> <li>• Reliance on routers can give rise to single points of failure and a network which is not robust or reliable.</li> </ul>	<p><b>Flooding</b></p> <ul style="list-style-type: none"> <li>• broadcast transmission to all nodes in direct range</li> <li>• messages take multiple paths to reach their destination</li> <li>• all nodes forward to all nodes</li> <li>• No routers</li> <li>• heavy network congestion</li> </ul>
---	---

29

**Università Politecnica delle Marche**  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica
 

### Managed Flooding

Bluetooth mesh networking uses a specialised and highly optimized version of flooding called Managed Flooding.

No connection - No routing table - No set route - Broadcast transmission - Relay of messages (if enable) – No single point of failure - more reliable – more efficient

FLOODING

+

OPTIMIZATIONS

- Relay
- TTL (Time-to-Live)
- Message cache
- Friendship: Low Power Node and Friend Node
- Heartbeats
- Subnet

=

MANAGED FLOODING

30

 Università Politecnica delle Marche  
 Facoltà di Ingegneria  
 Corso di Laurea in Ingegneria Elettronica

**TTL** Time to Live, is a field included in all bluetooth mesh PDUs. It controls the maximum number of hops, over which a message will be relayed.

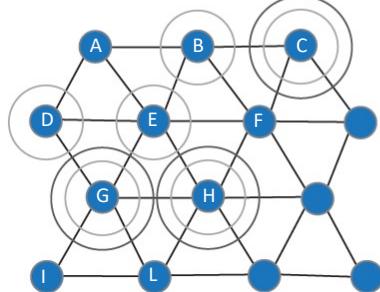

**Message cache** a Network Message Cache must be implemented by all nodes. The cache contains all recently seen messages and if a message is found to be in the cache, indicating the node has seen and processed it before, it is immediately discarded.

**Friendship** probably the **most significant optimisation** mechanism in a Bleutooth mesh Network. It is the relationship between Friend nodes and Low Power Node explained previously.

**Heartbeats** are messages transmitted by nodes periodically and they indicate to other nodes in network that the nodes sending the heartbeats is still active. In addition, a data is inserted that contains how far the sender is, in term of the numbers of hops.

**Subnet** to partition a mesh network. This is primarily for security purposes but it does also have the benefit that messages sent using a subnet are not relayed beyond that subnet. This conserves energy.

 Corso di Laurea in Ingegneria Elettronica

## Architecture

model layer
foundation model layer
access layer
upper transport layer
lower transport layer
network layer
bearer layer
Bluetooth Low Energy Core Specification

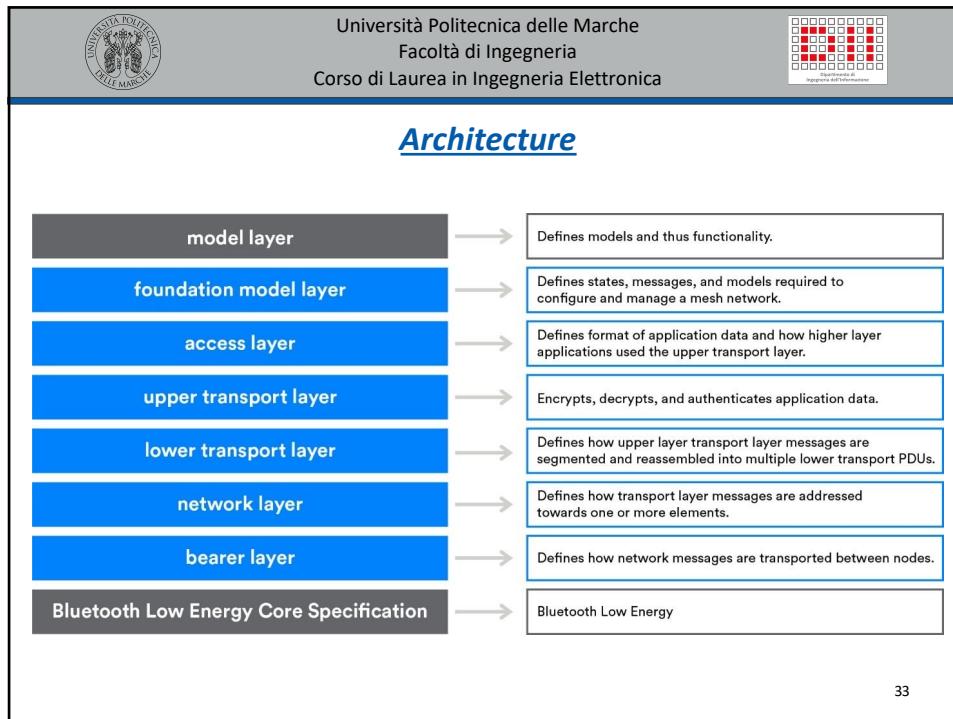

The reason for this backward compatibility derives from the fact that Bluetooth Mesh is **not an integral part** of the Bluetooth Low Energy stack, but is a **separate new entity** composed of seven levels.

**Any** Bluetooth Low Energy chip of the previous generation (4.0, 4.1, 4.2, 5) can be modified to run Bluetooth Mesh with a simple firmware update, which is a good thing for field installations to take advantage of the new technology.

Application	
GATT services	Mesh models
GAP	Access
GATT	Transport
ATT	Network
L2CAP	Bearer
Link Layer

### Security handled in Bluetooth Mesh

In the Bluetooth Mesh there are many types of security key, each for a specific purpose :  
Encryption, Obfuscation, Authentications

The diagram illustrates the key hierarchy and their uses:

- network key (netkey)**  
origin: provisioning  
use: derivation of other keys
- appkey**  
origin: created by the config. client and provided to nodes after provisioning  
use: secures application data at the upper transport layer  
*Bound to one or more models.*
- device key (devkey)**  
origin: established during provisioning  
use: secures communication between the config. client and individual node
- encryption key**  
origin: derived from netkey using the k2 function  
use: secures data at the network layer
- privacy key**  
origin: derived from netkey using the k2 function  
use: obfuscation of network header information

Relationships shown in the diagram:

- netkey → appkey (dashed arrow, labeled "appkey is bound to a netkey")
- netkey → devkey (dashed arrow, labeled "devkey is bound to all netkeys known to a node")
- netkey → encryption key
- netkey → privacy key

39

39

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

### Example

The diagram shows a message delivery path from House 1 to House 2, involving several nodes and security checks:

- House 1:** A message is sent from node 101 (addr: 101) to node 102 (addr: 102). The message is labeled "TO: LIGHTS TURN ON UPPER LIGHT (104)".
- Node 102:** The message is received and checked. It passes through security checks 2 and 4. Check 2: "RIGHT NETWORK? YES" (green), "RIGHT APP? YES" (green), "CAN READ WRONG ADDR PASSING ALONG" (blue). Check 4: "RIGHT NETWORK? YES" (green), "RIGHT APP? NO" (red), "CAN'T READ PASSING ALONG" (red).
- Node 103:** The message is received and checked. It passes through security check 5. Check 5: "RIGHT NETWORK? YES" (green), "RIGHT APP? NO" (red), "CAN'T READ PASSING ALONG" (red).
- Node 104:** The message is received and checked. It passes through security check 6. Check 6: "RIGHT NETWORK? YES" (green), "RIGHT APP? YES" (green), "TURN ON LIGHT" (green).
- House 2:** The message is received and checked. It passes through security check 7. Check 7: "RIGHT NETWORK? NO" (red), "CAN'T READ MESSAGE, CAN'T FORWARD" (red).
- Node 201:** The message is received and checked. It fails security check 8. Check 8: "RIGHT NETWORK? NO" (red), "CAN'T READ MESSAGE, CAN'T FORWARD" (red).

41

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Key Refresh**

When a node is removed for any reason (broken, network reduction, HW update) → A possible flaw is created in the security system of the mesh. The keys can be recovered from the deleted node

The standard provides a **Key Refresh** of all the keys of the entire network

Remove Node → Delete Old Keys → New Keys

42

42

Università Politecnica delle Marche  
Facoltà di Ingegneria  
Corso di Laurea in Ingegneria Elettronica

**Protection from replay attack**

Owner → car

Thief → capture all the information, impersonate the victim

Replay Attack

The Bluetooth Mesh standard, to protect against these types of attacks, uses two fields of the network PDU : **Sequence Number** and **IV index**.

Rules:

- Elements increment SEQ each time they send a command.
- A node, receiving a value of SEQ equal to or less than that of a previous valid message, will eliminate it.
- The values of the Index IV within the messages of a given element must always be equal to or greater than the last valid message of that element.

NID	CL	TTL	Sequence Number (SEQ)	Source Address (SRC)
octet 0	octet 1	octet 2	octet 3	octet 4

Destination Address (DST)	TransportPDU	Network MIC (NetMIC)
octet 7	octet 8	octet 9
